CHAPTER 1

INTRODUCTION

Crude oil is a yellow black naturally occurring liquid found in geological formations beneath the Earth's surface, it can be separated into various kinds of consumer fuels through the process of fractional distillation. Crude oil is the most important energy resources on the Earth right now. So far, it remains the world's leading fuel, with nearly one-third of global energy consumption. So, forecasting the price of crude oil is of great significance for energy policymakers, market participants, portfolio diversification, and energy risk management. There are many factors influencing the crude oil price, and the influence period of each factor on the crude oil prices is not consistent, so the crude oil prices have nonlinear characteristics.

However, identifying the formation process of crude oil prices is of significance for accurate prediction, but this process is complicated. Due to strong chain effects owned by this crude oil market, any changes in the factors involved will have exclusive impact to the price. Furthermore, the crude oil price contributes over 50% on the average price of petroleum and it is one of the most used commodities around the globe. Therefore, every increment and decrement that occurs to the crude oil price will then also give impact to the price of petroleum and later correspond to the global economy. A good prediction tool is crucial to be developed for this matter. Therefore, we try to use the machine learning methods to deal with the vague influence among various factors.

The formation process of crude oil prices can lead the traditional econometrics model to have a large error in crude oil price prediction, but the RNN and LSTM models can fit well. We have considered financialization of crude oil markets. The commodity attributes form the long-term trend of crude oil prices, and its financial attributes cause short-term fluctuation. In this paper, we try to forecast the price of crude oil from both spatial perspective and historical perspective.

1.1 PROJECT OVERVIEW

Crude oil is amongst the most important resources in today's world, it is the chief fuel and its cost has a direct effect on the global habitat, our economy and oil exploration, exploitation and other activities. Prediction of oil prices has become the need of the hour; it is a boon to many large and small industries, individuals, and the government. The evaporative nature of crude oil, its price prediction becomes extremely difficult and it is hard to be precise with the same. Several different factors that affect crude oil prices. The main advantage of this crude oil price prediction using artificial intelligence is continuously captures the unstable pattern of the crude oil prices which have been incorporated by finding out the optimal lag and number of the delay effect that controls the prices of crude oil.

1.2 PURPOSE

Oil demand is inelastic, therefore the rise in price is good news for producers because they will see an increase in their revenue. Oil importers, however, will experience increased costs of purchasing oil. Because oil is the largest traded commodity, the effects are quite significant. A rising oil price can even shift economic/political power from oil importers to oil exporters. The crude oil price movements are subject to diverse influencing factors.

This Project mainly focuses on applying Neural Networks to predict the Crude Oil Price. This decision helps us to buy crude oil at the proper time. Time series analysis is the best Option for this kind of prediction because we are using the previous history of crude oil prices to predict future crude oil. So we would be implementing RNN (Recurrent Neural Network) with LSTM (Long Short Term Memory) to achieve the task.

CHAPTER 2

LITERATURE SURVEY

S.NO	Title	Authors	Publication Date	Methodology	Merits	Demerits
1	Brent crude oil price forecast utilizing Deep Neural Network Architectures	Amir Daneshvar and Maryam Ebrahimi	05 May 2022	Artificial Neural Network, Deep Learning	The LSTM layers results in more accurate result.	Crude oil price signals exhibit highly nonlinear and complex behavior.
2.	Crude oil prices and volatility prediction by a hybrid model based on kernel extreme learning machine	Hongli Niu and Yazhi Zhao	17 September 2021	VMD-KELM	The VMD-KELM model shows a more powerful ability than other models in improving the precision of forecasting crude oil volatility.	-
3.	Crude oil price prediction using ANN	Nalini Gupta and Shobhit Nigam	January 2020	Artificial Neural Network	ANN model is effective. This capture the changing pattern of prices. Prediction is accurate.	Market trends have to be planned, then the ANN model will perform.
4.	Crude oil price prediction using complex network and deep learning algorithms	Makumbonori Bristone, Rajesh Prasad, Adamu Ali Abubakar	19 June 2019	Artificial Neural Network, Deep Learning	The appropriate number of LSTM layers can effectively improve the model.	The other factors that affect the crude oil price volatilities such as economic growth, exchange rate demand are not considered.
5.	Daily crude oil price forecasting using Hybridizing wavelet and Artificial Neural Network Model	Ani Shabri and Ruhaidah Samsudin	16 July 2014	Artificial Neural Network	The hybrid model showed a great improvement in crude oil price modeling and	-

					produced better forecasts than ANN model alone.	
6.	Machine Learning Approach for crude oil price prediction with Artificial Neural Networks- Quantitative (ANN-Q) model	Abdullah	-	Artificial Neural Network	Returns function had successfully proved to cleanse and uniform the data from errors and noises hence, the crisp prediction result.	
7.	A novel look back N feature approach towards prediction of crude oil price	Rudra Kalyan Nayak	-	ARIMA, LBNF Algorithm	Attained better training and accuracy by shifting the dataset into n class problem and more scope to classifier.	-

2.1 EXISTING PROBLEM

Several machine learning techniques were proposed for oil price prediction, such as artificial neural networks and support vector machine. These are nonlinear models which may produce more accurate predictions if the oil price data are strongly nonlinear. However, these machine learning techniques, like other traditional machine learning techniques, rely on a fixed set of training data to train a machine learning model and then apply the model to a test set. Such an approach works well if the training data and the test data are generated from a stationary process but may not be effective for non-stationary time series data such as oil price data.

2.3 PROBLEM STATEMENT DEFINITION

The crude oil price prediction task is interesting as well as divides researchers and academics into two groups those who believe that we can devise mechanisms to predict the market and those who believe that the market is efficient and whenever new information comes up the market absorbs it by correcting itself, thus there is no space for prediction.

CHAPTER 3

IDEATION AND PROPOSED SOLUTION

3.1 EMPATHY MAP AND CANVAS

3.2 IDEATION AND BRAINSTORMING

Template

Brainstorm & idea prioritization

Use this template in your own brainstorming sessions so your team can unleash their imagination and start shaping concepts even if you're not sitting in the same room.

🕒 10 minutes to prepare

🕒 1 hour to collaborate

👤 2-8 people recommended

🗨️ Share template feedback

➔

Before you collaborate

A little bit of preparation goes a long way with this session. Here's what you need to do to get going.

🕒 10 minutes

A

Team gathering
Define who should participate in the session and send an invite. Share relevant information or pre-work ahead.

B

Set the goal
Think about the problem you'll be focusing on solving in the brainstorming session.

C

Learn how to use the facilitation tools
Use the Facilitation Superpowers to run a happy and productive session.

Open article

➔

1

Define your problem statement

What problem are you trying to solve? Frame your problem as a How Might We statement. This will be the focus of your brainstorm.

🕒 5 minutes

PROBLEM

How crude oil price can be predicted?
What are the ways to predict and what are the impacts?

Key rules of brainstorming

To run a smooth and productive session

🕒 Stay in topic.

💡 Encourage wild ideas.

🕒 Defer judgment.

👂 Listen to others.

🗣️ Go for volume.

👁️ If possible, be visual.

8

2

Brainstorm

Write down any ideas that come to mind that address your problem statement.

10 minutes

TP
You can select a sticky note and let the pencil touch to sketch (don't start drawing)

Mohammed Sufyan

can be predicted using the data	can be predicted using the data	can be predicted using the data

Prembabu

can be predicted using the data	can be predicted using the data	can be predicted using the data

Jack Melony

can be predicted using the data	can be predicted using the data	can be predicted using the data

Mathimithran

can be predicted using the data	can be predicted using the data	can be predicted using the data

3

Group ideas

Take turns sharing your ideas while clustering similar or related notes as you go. Once all sticky notes have been grouped, give each cluster a sentence-like label. If a cluster is bigger than six sticky notes, try and see if you can break it up into smaller sub-groups.

20 minutes

Basic level

can be predicted using the raw data

Artificial Intelligence can be very helpful in prediction

Sampling and scoring are used for prediction

TP
And customize tags to sticky notes to make it easier to find, remove, organize, and categorize important ideas as they come to the group.

Advanced level

Deep learning can be used for analysis

History of prices can be used for references

The integration of AI and Machine Learning will be useful

Python can be used to represent the losses

The general results can be calculated and can be used for prediction

Artificial Intelligence can be used for prediction

The prediction can be done by comparing the value from the different time period

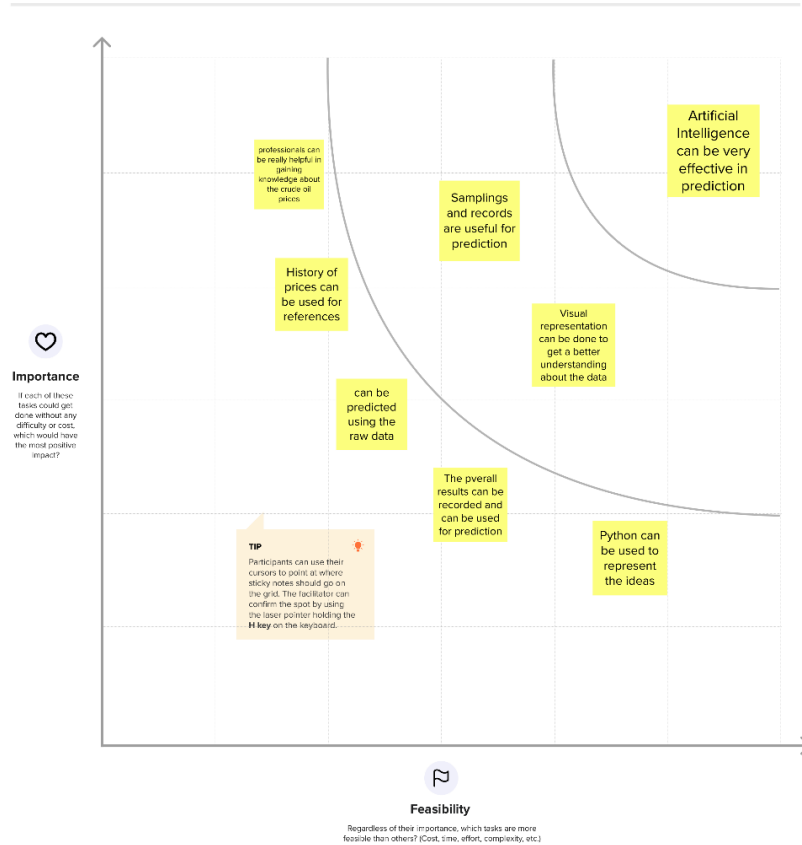

Visual representation can be done to get better understanding about the data

4

Prioritize

Your team should all be on the same page about what's important moving forward. Place your ideas on this grid to determine which ideas are important and which are feasible.

🕒 20 minutes

→

After you collaborate

You can export the mural as an image or pdf to share with members of your company who might find it helpful.

Quick add-ons

- A Share the mural**
Share a view link to the mural with stakeholders to keep them in the loop about the outcomes of the session.
- B Export the mural**
Export a copy of the mural as a PNG or PDF to attach to emails, include in slides, or save in your drive.

Keep moving forward

- Strategy blueprint**
Define the components of a new idea or strategy.
[Open the template →](#)
- Customer experience journey map**
Understand customer needs, motivations, and obstacles for an experience.
[Open the template →](#)
- Strengths, weaknesses, opportunities & threats**
Identify strengths, weaknesses, opportunities, and threats (SWOT) to develop a plan.

[Share template feedback](#)

3.3 PROPOSED SOLUTION

S.No.	Parameter	Description
1.	Problem Statement (Problem to be solved)	As with the erratic changes in supply and demand and also the influence of geopolitics, it is very hard to predict the value of crude oil prices in the global market.
2.	Idea / Solution description	We are going to collect the dataset of the past oil prices with time so that by feeding those to the model and training it and compiling it and when it's achieved the optimal state we can implement it in the web application.
3.	Novelty / Uniqueness	It may be a traditional idea but the implementation of periodic training will have a better effect on it.
4.	Social Impact / Customer Satisfaction	By using the web app customer can gain knowledge of the crude oil price and get benefits financially.
5.	Business Model (Revenue Model)	It will be used by every individual at ease so that they can have an idea of the crude price so, that the use of the crude will be stable in the market
6.	Scalability of the Solution	The idea we proposed it take the input in the periodic and adjust and train through these so, that it will adapt to very different situations.

3.4 PROBLEM SOLUTION FIT

<p>Define CS, fit into CC</p> <p>1. CUSTOMER SEGMENT(S) CS Who is your customer?</p> <p>Crude Oil Based Industries and companies for Business purposes. Handle transportation and storage in the Business.</p>	<p>6. CUSTOMER CONSTRAINTS CC What constraints prevent your customers from taking action or limit their choices of solutions?</p> <p>The risks and problems are the obstacles for the customers which limits them from proceeding further in the process.</p>	<p>5. AVAILABLE SOLUTIONS AS Which solutions are available to the customers when they face the problem or need to get the job done? What have they tried in the past? What pros & cons do these solutions have?</p> <p>The frustrations about the results can be avoid by providing a proper timeline and proper planning will be helpful in finishing it in time with the expected output.</p>	<p>Explore AS, differentiate</p>
<p>Focus on J&P, tap into BE, understand RC</p> <p>2. JOBS-TO-BE-DONE / PROBLEMS J&P Which jobs-to-be-done (or problems) do you address for your customers?</p> <p>The difficulty in predicting the Crude Oil Price more accurately is one of the major problems The information to be collected for providing the desired results may be a problem</p>	<p>9. PROBLEM ROOT CAUSE RC What is the real reason that this problem exists? What is the back story behind the need to do this job?</p> <p>It can both Man-made error or machine error which can sometimes go wrong. This can cause a problem in proving an accurate or desired result. This is the main root cause of this issue.</p>	<p>7. BEHAVIOUR BE What does your customer do to address the problem and get the job done?</p> <p>The problems faced by the customer can be reported in a form of a detailed document. So that it can be properly addressed by the team and it can rectify.</p>	<p>Focus on J&P, tap into BE, understand RC</p>
<p>Identify strong TR & EM</p> <p>3. TRIGGERS TR What triggers customers to act?</p> <p>The business ideas trigger customers for the crude oil price prediction for the benefits</p> <p>4. EMOTIONS: BEFORE / AFTER EM How do customers feel when they face a problem or a job and afterwards?</p> <p>If the results are not up to the expected point, it makes them feel frustrated.</p>	<p>10. YOUR SOLUTION SL If you are working on an existing business, write down your current solution first fill in the canvas, and check how much it fits reality. If you are working on a new business proposition, then keep it blank until you fill in the canvas and come up with a solution that fits within customer limitations, solves a problem and matches customer.</p> <p>To address this issue, it needs proper attention in carrying out this process for predicting the crude oil price. Both computer-aided prediction and human calculations should be carried out very carefully.</p>	<p>8. CHANNELS of BEHAVIOUR CH 8.1 ONLINE What kind of actions do customers take online? Extract online channels from #7</p> <p>Discount seekers Wandering customers Loyal customers</p> <p>8.2 OFFLINE What kind of actions do customers take offline? Extract offline channels from #7 and use them for customer development.</p> <p>Reliable customers Trustful customers</p>	<p>Extract online & offline CH of BE</p>

CHAPTER 4

REQUIREMENT ANALYSIS

4.1 FUNCTIONAL REQUIREMENTS

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	User Registration	Registration through Form Registration through Gmail
FR-2	User Confirmation	Confirmation via Email Confirmation via OTP
FR-3	Graph	Showing graph by obtaining the data from the dataset
FR-4	Support	Providing answers for the queries asked by users.
FR-5	News	Information of the oil prices will be updated by admin
FR-6	Notification	Notification will be sent for the users price alert
Fr-7	Database	Information of the User will be stored

4.2 NON -FUNCTIONAL REQUIREMENTS

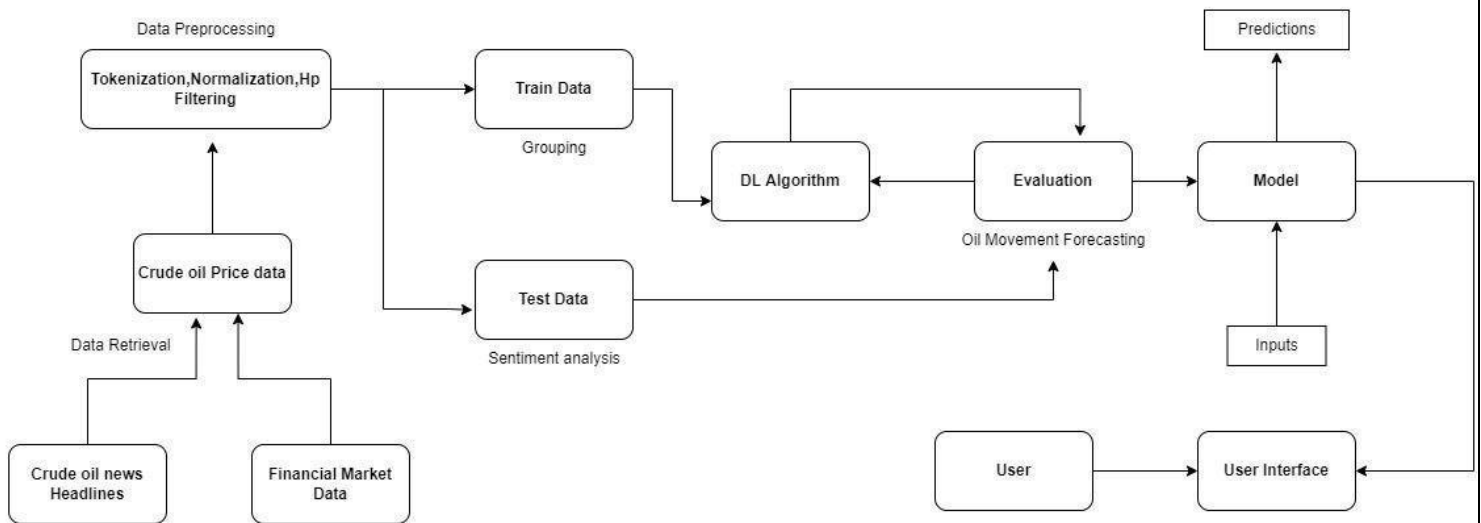

FR No.	Non-Functional Requirement	Description
NFR-1	Usability	It can use by wide variety of client as it is very simple to learn and not complex to proceed.
NFR-2	Security	We are using login for the user and the information will be hashed so that it will be very secure to use.
NFR-3	Reliability	It will be reliable that it can update with very time period so that the accuracy will be good.
NFR-4	Performance	It will be perform fast and secure even at the lower bandwidth.
NFR-5	Availability	Prediction will be available for every user but only for premium user news,database and price alert will be alert.
NFR-6	Scalability	It is scalable that we are going to use data in kb so that the quite amount of storage is satisfied.

CHAPTER 5

PROJECT DESIGN

5.1 DATAFLOW DIAGRAMS

DATA FLOW DIAGRAM

5.2 SOLUTION AND TECHNICAL ARCHITECTURE

Application Characteristics:

S.No	Characteristics	Description	Technology
1.	Open-Source Frameworks-1	Python,	Pandas, flask, numpy, tensorflow
2.	Open-Source Frameworks-2	JavaScript, Angular Js.	App module, component module
3.	Security Implementations	User data will be stored according to CIA model.	End to end encryption (SHA-256)
4.	Scalable Architecture	IBM cloud and firebase both used for better performance in storage and authentication.	IBM watson, Firebase, Mysql
5.	Availability	Handle huge requests, avoid DDOS and XSS attack.	Effective coding and restrictive user access based on need
6.	Performance	Handle more than 1000 users to use server at a time.	Flask

Components & Technologies:

S.No	Component	Description	Technology
1.	User Interface	Web application	HTML, CSS, JavaScript, Angular Js
2.	Application Logic-1	Logic for a process in the Application	Python
3.	Application Logic-2	Logic for a process in the application	IBM Watson Assistant
4.	Database	Data Type, Configurations	MySQL
5.	Cloud Database	Database Service on Cloud	IBM cloud
6.	File Storage	File storage requirements	IBM Block Storage, Local Filesystem
7.	External API-1	Purpose of External API used in the Application	Firebase
8.	Machine Learning Model	Purpose of Machine Learning Model	Recurrent neural network & LSTM
9.	Infrastructure (Server / Cloud)	Application Deployment on Local System / Cloud Local Server Configuration: Cloud Server Configuration:	Local, Firebase.

Technical Architecture

5.3 User stories

User Type	Functional Requirement (Epic)	User Story Number	User Story/ Task	Acceptance criteria	Priority	Release
Customer (Mobile User)	Registration	USN-1	As a user,I can register for the application by entering my email, password,and confirming my password.	I can accessmy account/ Displays Line graph / Bar graph.	High	Sprint-1
		USN-2	As a user,I will receive confirmation email once I have registered for the application	I can receive confirmation email & click confirm	High	Sprint-1
		USN-3	As a user,I can register for the application through Facebook	I can register & accessthe my Account	Low	Sprint-2
		USN-4	As a user,I can register for the application through Gmail	I can register through already logged in gmail account.	Medium	Sprint-1
	Login	USN-5	As a user,I can log into the application by entering email & password	After registration,I can log in by only email & password.	High	Sprint-1
	Line\Bar graph		After entering the inputs,the model will display predictions in Line\Bar Graph Format.	I can get the expected prediction in various formats.	High	Sprint-3
Customer (Web user)	Login	USN-1	As the web user,I can login simply by using Gmail or Facebook account.	Already created gmail can be used for Login.	Medium	Sprint-2
Customer Care Executive	Support		The Customer care service will provide solutions for any FAQ and also provide ChatBot.	I can solve the problems arised by Support.	Low	Sprint-3
Administ rator	News		Admin will give the recent news of Oil Prices.	Provide the recent oil prices.	High	Sprint-4
	Notificatio n		Admin will notify when the oil prices changes.	Notification by Gmail.	High	Sprint-4
	Access Control		Admin can control the access of users.	Access permission for Users.	High	Sprint-4
	Database		Admin can store the details of users.	Stores User details.	High	Sprint-4

Chapter 6

PROJECT PLANNING & SCHEDULING

6.1 Sprint Planning & Estimation

Sprint	Functional Requirement (Epic)	User Story Number	User Story / Task	Story Points	Priority	Team Members
Sprint-1	Registration	USN-1	As a user, I can register for the application by entering my email, password, and confirming my password.	10	High	Mohammed Sufiyan F
Sprint-1		USN-2	As a user, I will receive confirmation email once I have registered for the application	10	High	Prembabu C
Sprint-1	Login	USN-3	As a user, I can log into the application by entering email & password.	15	High	Jack Melony G
Sprint-2	Input Necessary Details	USN-4	As a user, I can give Input Details to Predict Likelihood of crude oil	15	High	Mathimithran T
Sprint-2	Data Pre-processing	USN-5	Transform raw data into suitable format for prediction.	15	High	Mohammed Sufiyan F
Sprint-3	Prediction of Crude Oil Price	USN-6	As a user, I can predict Crude oil using machine learning model.	20	High	Prembabu C
Sprint-3		USN-7	As a user, I can get accurate prediction of crude oil	5	Medium	Jack Melony G
Sprint-4	Review	USN-8	As a user, I can give feedback of the application.	20	High	Mathimithran T

6.2. Sprint Delivery Schedule

Sprint	Total Story Points	Duration	Sprint Start Date	Sprint End Date (Planned)	Story Points Completed (as on Planned End Date)	Sprint Release Date (Actual)
Sprint-1	20	6 Days	24 Oct 2022	29 Oct 2022	20	29 Oct 2022
Sprint-2	20	6 Days	31 Oct 2022	05 Nov 2022	20	05 Nov 2022
Sprint-3	20	6 Days	07 Nov 2022	12 Nov 2022	20	12 Nov 2022
Sprint-4	20	6 Days	14 Nov 2022	19 Nov 2022	20	19 Nov 2022

8.2 User Acceptance Testing

The purpose is to briefly explain the test coverage and open issues of the crude oil priceprediction project at the time of the release to user acceptance testing.

Defect Analysis:

Resolution	Severity 1	Severity 2	Severity 3	Severity 4	Subtotal
By Design	3	0	0	0	3
Duplicate	1	0	1	0	2
External	0	0	0	0	0
Fixed	4	0	1	1	6
Not Reproduced	0	0	0	0	0
Skipped	0	0	0	0	0
Won't fix	0	0	0	1	1
Totals	8	0	2	2	12

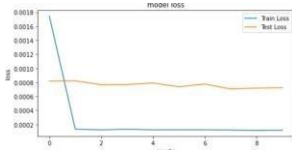

Test case analysis:

Section	Total Cases	Not Tested	Fail	Pass
ML Model	4	0	0	4
Flask Application	4	0	0	4
IBM Cloud	4	0	0	4
Exception Reporting	2	0	0	2
Final Report Output	4	0	0	4

CHAPTER 9

RESULT

9.1 Performance Metrics:

dense_1 (Dense)	(None, 1)	51																
2	Accuracy		<div></div>															

We use different standard performance metrics in the oil price prediction literature for comparing different oil price prediction models. The first metric is Mean Squared Prediction Error (MSPE). MSPE of a prediction model measures the average of the squares of the prediction errors. The prediction error is the difference between the true value and the predicted value. Let y_1, y_2, \dots, y_n be the true oil prices and $\hat{y}_1, \hat{y}_2, \dots, \hat{y}_n$ be the predicted oil prices under an oil price prediction model, and then the MSPE of that model is:

$$MSPE = \frac{1}{n} \sum_{i=1}^n (\hat{y}_i - y_i)^2$$

For comparison purposes, we use the no-change model as the baseline model and express the MSPE of another model as a ratio relative to the MSPE of the no-change model. If the MSPE ratio of a model is less than 1, then the model is more accurate than the no-change model in terms of MSPE.

CHAPTER 10

ADVANTAGES AND DISADVANTAGES

ADVANTAGES:

LSTM models have great advantages in terms of mining the long-term dependence of crude oil price sequence data. Furthermore, LSTM models can automatically search for nonlinear features and complex patterns of crude oil prices, which shows excellent forecasting performance in crude oil price prediction. As a very powerful prediction tool, LSTM has been widely used in prediction-related fields. Therefore, to forecast crude oil price more accurately, we have selected the LSTM model for this study.

The different gates inside LSTM boost its capability for capturing nonlinear relationships for forecasting. Causal factors generally have non-linear impact on demand. When these factors are used as part of the input variable, the LSTM could learn the nonlinear relationship for forecasting.

It is natural that events would impact demand on the day when it is happening as well as the days before and after the event is happening. For example, people would book more days of accommodation to attend a sports event. The LSTM could triage the impact patterns from different categories of events.

- No complexity (web app works to the point)
- Faster response (less latency)
- Can be scaled easily
- Simple user interface
- Light weight

DISADVANTAGES:

They became popular since they solved the issue of gradients disappearing. However, that they are unable to eliminate the problem. The issue lies in that data needs to be moved between cells for its analysis. Furthermore, the cell is becoming extremely complex with the addition of functions (such as the forget gate) that are now part of the picture.

LSTMs are affected by various random weights and behave similarly to neural networks that feed forward. They favour small initialization over large weights.

With the growing technology of data, mining scientists are searching for a system that can store past data for more extended periods of time than LSTMs. The motivation behind the development of such a model is the habit of humans of dividing a particular chunk of information into smaller parts to facilitate recollection.

- Flask can handle only smaller application.
- The user need to enter past 10 days crude oil price values, it may cause discomfort to the end users even though they can get the result immediately.
- Maintenance cost because of Flask.

CHAPTER 11

CONCLUSION

The web app will provide the best service to the end users (mainly INVESTORS) who are expert in investing and just looking for the crude oil price for their benefit as the web app will not let them wait and gives response in no time. Our Web app shows that our model achieves the highest accuracy in terms of both mean squared prediction error and directional accuracy ratio over a variety of forecast time horizons. The model used in our web app is LSTM (Long Short Term Memory). LSTM leads to more successful runs and learns much faster in compare to other algorithms like RTRN, BPTT, and RCC etc. LSTM also solves complex. The complexity to update each weight is reduced to $O(1)$ with LSTM which is an added advantage. The LSTM cell adds long term memory in an even more performant way because it allows even more parameters to be learnt. This makes it the most powerful RNN (Recurrent Neural Network) to do forecasting, especially when you have a longer term trend in your data. IBM Watson provides tool to work collaborative and make work easier with data as well as in training the model. IBM Watson enables one-click deployment with Machine-Learning.

Immediate response:

The end users don't need to wait for longer seconds. The end users will get what they are looking for in just a second. There is no latency.

Scalability:

As our web app is deployed on IBM cloud, the code can be managed and deployed easily. If the numbers of users are monotonically increased, our web application can be scaled in no time.

CHAPTER 12

FUTURE SCOPE

The current market situation, amid the Covid-19 outbreak, is not expected to last for the long- term; however, its long term effect on the markets may be felt for a few years to come, especially with the threat of a recession also coming from this outbreak. This could ripple out and affect the long term oil price forecast, and will need to be taken into consideration. There's also a delta variant spreading that is causing a return of lockdowns in some regions which could once again harm oil prices.

Oil price predictions long term are still vitally important to the oil investing market as the commodity, although quite volatile, is one that is often traded over longer periods of time. Oil is also a commodity that is still in high demand, and is finite, so it is expected to grow in demand over the long terms. Additionally, the prediction of oil in the long term is something that is important to different groups in the industry.

Compared with the ANN and ARIMA model, the average prediction accuracy of the LSTM model was 66.67% (33.33%) and 439587 (673.8) times higher, respectively. So, we can conclude that the LSTM model can improve the forecasting accuracy for both kinds of prices in the short term.

The number of investors in crude oil is keep on increasing as it is still in high demand. When youngsters are interested in investing but when they are in beginning stage surely our web app provide a greater service to make them understand the pattern everyday by giving them the prediction.

As price of crude oil is a complex changing pattern and new price comes every time, it is important to update our model. As we use LSTM model the complexity is very reduced to $O(1)$ the model doesn't take more time to retrain the model with new data, helping us to easily serve for the customers with better accuracy.
